## DESCRIPTION OF PROJECT

This project includes adding a single-story restroom to the Ventia Valley elementary school in San Rafael, California.

The structure has a gable roof supported by $2 \times 10$ joists spaced at 24 " o.c. A single glulam beam ridge beam is supporting the joists. The gable roof has a 5 ' long overhang. Roof is supported by wood stud walls along the perimeter.

Exterior wood shear walls are the main lateral force resisting system in the structure in both directions.

The structure is supported on $18^{\prime \prime}$ wide $\times 24^{\prime \prime}$ deep grade beams along the perimeter of the building.

## Notes:

$\Sigma \mathrm{M}_{\mathrm{OT}}=$ Sum of overturning moments at story, ASD
$\Sigma \mathrm{M}_{\mathrm{R}}=$ Sum of resisting moments at story
$M_{\text {NET }}=$ net overturning moment using the LC: $E-\left(0.6-0.14 S_{D S}\right)^{*} D L$ $T=$ resulting uplift: $M_{\mathrm{NET}} / L_{\text {eff }}$
$L_{w, \text { eff }}=$ Effective width of wall for resisting couple, taken as length of wall minus 2 ft
(1) Leff updated manually to account for gravity posts
$\mathrm{T}_{\text {LRFD }}=$ calculated using LC: $1.4 \mathrm{E}-\left(0.9-0.2 \mathrm{~S}_{\text {DS }}\right)^{*} \mathrm{DL}$, used for tiedown anchorage design
For a sample hand calculation of how the values in each row are calculated, see following pages.

## Foundation Design

Seismic governs the design for foudnation.

Overturnning Seismic governs the design for overturning.
Consider the entire building as one unit
Min. effect ASD load combination (0.6-0.14Sds)D $+0.7 E$
$O T M:=0.7 \cdot M \_E=97.125 \mathrm{kip} \cdot \mathrm{ft}$
Total weight of the building including foundation:
Ptotal $:=W+\gamma c \cdot((2 \cdot L+4 \cdot(B-B g b)) \cdot D g b \cdot B g b+(B+B g b) \cdot(L+B g b) \cdot t s l a b)=183.57 \mathrm{kip}$
Resisting Moment:
$M o:=(0.6-0.14 S d s) \cdot$ Ptotal $\cdot \frac{(B+B g b)}{2}=951.627 \mathrm{kip} \cdot \mathrm{ft}$

Factor of Safety against overturning moment:
$F S:=\frac{M o}{O T M}=9.798 \quad$ OK

Notes: 1. (+) and (-) signs signify wind pressures acting toward \& away from respective surfaces.
2. Width of Zone $1 \& 2$ (edge), ' $0.6^{*} a^{\prime}=$
3. Width of Zone 3 (corner), '0.6*a' \& '0.2*a'=

| 1.80 | ft. |
| :--- | :--- |
| 1.80 | 0.60 | ft.

4. For monoslope roofs with $\theta<=3$ degrees, use Fig. 30.4-2A for 'GCp' values with 'qh'.
5. For buildings with $h>60$ ' and $\theta>10$ degrees, use Fig. 30.6-1 for 'GCpi' values with 'qh'.
6. For all buildings with overhangs, use Fig. 30.4-2B for 'GCp' values per Sect. 30.10.
7. If a parapet $>=3^{\prime}$ in height is provided around perimeter of roof with $\theta<=7$ degrees,

Negative Zone 3 shall be treated as Zone 2; Positive Zone 2 \& 3 shall be treated as Zone 4 \& 5
8. Per Code Section 30.2.2, the minimum wind load for $C \& C$ shall not be less than 16 psf.
9. References : a. ASCE 7-16, "Minimum Design Loads for Buildings and Other Structures".

FIGURE 1.3: No. 16 Gauge Standard Clip - Material Properties and Figures (Typical)

## ZONE 3 r

Penetration Depth $=5 / 8 "$
Nominal Capacity at $3^{\prime}-0^{\prime \prime}$ spacing $=84.4$ psf
Penetration reduction factor $=0.625$
LRFD to ASD conversion $=1 / 0.4=2.5$
Actual capacity $=84.4 \times 0.625 \times 2.5=131.875 \mathrm{psf}$
Factored max wind demand $(3 \mathrm{r})=0.6 \times 67.77 \mathrm{psf}=$ 40.66 psf

Factor of Safety = 2
DCR $=40.66 \times 2 / 131.875<1$
Spacing 3' - 0" acceptable for zone 3 r.

All other zones:
Penetration Depth $=5 / 8^{\prime \prime}$
Nominal Capacity at $3^{\prime}-6 "$ spacing $=72.4$ psf
Penetration reduction factor $=0.625$
LRFD to ASD conversion $=1 / 0.4=2.5$
Actual capacity $=72.4 \times 0.625 \times 2.5=113.125 \mathrm{psf}$
Factored max wind demand $(3 \mathrm{r})=0.6 \times 60.31 \mathrm{psf}=36.2$ psf
Factor of Safety $=2$
DCR $=36.2 \times 2 / 131.875<1$
Spacing 3' ${ }^{\prime}$ 6" acceptable for zone 3 r.

## Roof Components and Cladding:

Roof Zones for Buildings with $\mathrm{h}<=\mathbf{6 0} \mathrm{ft}$. (for Gable Roofs $<=45^{\circ}$ and Monoslope Roofs $<=3^{\circ}$ )

Roof Zones for Buildings with $\mathrm{h}>60 \mathrm{ft}$. (for Roofs $<=7^{\circ}$ )

Evaluation repori Number: 686

FIGURE1.6 - Series 300 - 0.040-inch and 0.050 -inch thick Aluminum:

TABLE 1.13-0.040-thick Aluminum Section Properties:
.040" Aluminum x 18" Panel Properties

| Thickness | $0.040 \mathrm{in} .($ nom $)$ | $\mathrm{Ix}($ top $)$ | 0.450 in 4 | $\emptyset \mathrm{M}_{\mathrm{n}}$ (top) | 4.02 k -in |
| ---: | ---: | ---: | ---: | ---: | ---: |
| Type | $3105-\mathrm{H} 25$ | Ix (bot) | 0.430 in 4 | $\emptyset \mathrm{M}_{\mathrm{n}}$ (bot) | 5.42 k -in |
| Width | $18 \mathrm{in}. \mathrm{(nom)}$ |  |  | $\emptyset \mathrm{~V}_{\mathrm{n}}$ | 1.340 k |
| $\mathrm{F}_{\mathrm{y}}$ | 19 ksi |  |  |  |  |
| E | $10,100 \mathrm{ksi}$ |  |  |  |  |

For SI: 1 inch $=2.54 \mathrm{~mm} ; 1 \mathrm{ksi}=6.89 \mathrm{MPa} ; 1 \mathrm{kip}=1000 \mathrm{lbs}$.
Notes:

1. Section properties are calculated in accordance with the ADM1-2015, Aluminum Design Manual: Part 1-A Specification for Aluminum Structures.
2. The section properties also shall be used for the 0.050 -inch panels.
3. The 0.050 - and 0.040 -inch aluminum panel loads may be designed by a registered design professional using the Section Properties in Table 1.13 of this report.
4. E is the modulus of elasticity.
5. $F_{y}$ is the yield strength.
6. $\mathrm{I}_{\mathrm{xe}}$ is the effective moment of inertia about the cross-section about the x -axis.
7. $\mathrm{M}_{\mathrm{n}}$ is the nominal bending strength.
8. $\mathrm{V}_{\mathrm{n}}$ is the nominal shear strength.

Check Panel Strength:
Trib Width of Panel = Building Width / $2=22.5^{\prime} / 2=11.25^{\prime}$
$\mathrm{W}=66.8 \mathrm{psf} \times 11.25$ ' $=751.5 \mathrm{plf}$
$\mathrm{Mu}=\mathrm{WL} \wedge 2 / 8=751.5 \times(1.5)^{\wedge} 2 / 8=211 \mathrm{lbs}-\mathrm{ft}=2.5 \mathrm{kip}-\mathrm{in}<\mathrm{Mn}$ listed in Table 1.13 above $-->$ OK!

For clip capacity, see Table 1.16 in ER 686 shown below:
Allowed wind load $=141$ psf >> 66.7 psf
TABLE 1.16 - Clip Wind Negative (Uplift) Design Load:

|  | T1.16 Series su0 Panel/clip Wind Uplift Design Load, PSF |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | .040 ${ }^{\text {I }}$ or . $0500^{\text {" }}$ Aluminum with $18^{\text {II }}$ o.c. Seam Spacing |  |  |  |  |  |  |  |  |  |  |
|  | Standard 16 GA Clip Anchors |  |  |  |  |  |  |  |  |  |  |
|  | Clip Spacing (Span), Feet |  |  |  |  |  |  |  |  |  |  |
|  | 6.0 | 5.5 | 5.0 | 4.5 | 4.0 | 3.5 | 3.0 | 2.5 | 2.0 | 1.5 | 1.0 |
| Max. Design Load, PSF | 44.8 | 55.5 | 66.2 | 77.0 | 87.7 | 98.4 | 109.1 | 119.8 | 130.6 | 141.3 | 152.0 |

For SI: 1 inch $=25.4 \mathrm{~mm} ; 1$ foot $=305 \mathrm{~mm} ; 1 \mathrm{psf}=47.9 \mathrm{~Pa}$

1. The wind uplift nominal strength has been determined according to the procedures of AISI S906, with a resistance factor, $\Phi=0.80$ in accordance with AISI S100-12 D6.2.1.
2. Design loads shown are factored loads for use with LRFD load combinations.
3. Intermediate design values have been determined based on linear interpolation between tested values based on Section 5.4.3.2 of EC0112019.
4. The allowable service load deflections for metal roof panels shall be taken as $\mathrm{L} / 60$.
5. Wind uplift design loads may be further limited by the design strength of the anchor fasteners into the roof substrate. The tests conducted in accordance with ASTM E1592, shown in this table, utilized two $1 / 4 "-14 \times 1.25 "$ HWH self-drilling tapping screws per anchor/ purlin connection. For other fastener types or roof substrates, the faster design strength shall be designed by the registered design professional.
6. Tables 1.1 and 1.2 of this report have been provided for the fastener design strength of a frequently used screw type into typical metal and wood roof substrates.
